

Interleukin-2 (IL-2) is produced by activated T cells and promotes proliferation, differentiation and survival of antigen-activated T cells and NK cells. ELISA can be used to quantify IL-2 in solution, and ELISpot and FluoroSpot are excellent tools to analyze frequencies and cytokine profiles of antigen-responding T cells.

We provide **ELISA** development kits and ELISA<sup>PRO</sup> kits for detection of IL-2. The graph shows a representative standard curve.

For analysis of IL-2 by **ELISpot** we offer basic ELISpot kits as well as kits supplied with pre-coated plates. In the image, PBMCs were incubated overnight with or without anti-CD3.

Detect IL-2 using single **FluoroSpot** or combine it with IFN- $\gamma$  and TNF- $\alpha$  in our dual and triple FluoroSpot kits. In the image, PBMCs were incubated overnight with or without a pool of viral peptides (CEF).
