Detection of IFN- γ by flow cytometry in viable ferret spleen cells. Cells were stimulated for 16 hours in the presence of PMA/ionomycin and Brefeldin A. Cells were then fixed and permeabilized using 4% paraformaldehyde and saponin, and subsequently stained with MTF14-PF647P (right panel). The left panel depicts cells stained with a matched isotype control antibody. The dot plots derive from gated events of typical lymphocyte characteristics in forward and side light scatter. Flow cytometry was performed on a BD FACSVerser system.
