

# ELISpot Path: SARS-CoV-2 (S1 scan+SNMO) Human IFN- $\gamma$ (HRP)

Product Code: 3420-4HST-P1-1

---

## CONTENTS:

**1 pre-coated strip plate (mAb 1-D1K) and empty plate frame.**

Biotinylated detection mAb 7-B6-1, 1 mg/ml (40  $\mu$ l)

Streptavidin-HRP (40  $\mu$ l)

SARS-CoV-2 SNMO defined peptide pool

SARS-CoV-2 S1 scanning pool (2 vials: pool 1 and pool 2)

Co-stimulator anti-CD28 mAb CD28-A, 0.1 mg/ml (100  $\mu$ l)

Positive control anti-CD3 mAb CD3-2 (100  $\mu$ l)

**TMB substrate (25 ml)**

The detection antibody is supplied in sterile filtered (0.2 $\mu$ m) PBS with 0.02% sodium azide. Streptavidin-HRP is supplied in PBS with 0.002% Kathon CG. Anti-CD3 mAb are supplied in sterile filtered (0.2  $\mu$ m) PBS. Vials have been overfilled to ensure recovery of the specified amount.

## STORAGE:

Shipped at ambient temperature. On arrival all reagents should be stored refrigerated at 4-8 °C except the peptide pools that should be stored frozen at -20°C or below. Plates should be kept at room temperature. The expiry date indicates how long unopened products, stored according to instructions, are recommended for use.

# Guidelines

Please read through before starting the assay

## A Preparation of ELISpot plate (sterile conditions)

1. Remove the plate from the sealed package and wash 4 times with sterile PBS (200  $\mu$ l/well).
2. Condition the plate with medium (200  $\mu$ l/well) containing 10% of the same serum as used for the cell suspensions. Incubate for at least 30 minutes at room temperature.

## B Incubation of cells in plate (sterile conditions)

1. The peptide pools can be used separately or mixed. If used separately, dissolve the peptide pools by addition of 40  $\mu$ l DMSO to each vial, then add 85  $\mu$ l PBS. If used mixed, add 40  $\mu$ l DMSO to one vial and transfer the solution to the next vials serially. Add 85  $\mu$ l PBS to the last vial. The concentrations of these stock solutions are 200  $\mu$ g/ml of each peptide. Aliquot the pools and store at -20°C or below.  
Empty the plate and add 50  $\mu$ l/well of peptides or controls, followed by 50  $\mu$ l cell suspension/well. Alternatively, mix cells and stimuli before addition of 100  $\mu$ l/well. The final peptide concentration should be 2  $\mu$ g/ml of each peptide. Anti-CD28 can be included at a final concentration of 0.1  $\mu$ g/ml. Anti-CD3 is recommended as a positive control at a dilution of 1:1000.
2. Put the plate in a 37°C humidified incubator with 5% CO<sub>2</sub> and incubate for 12-48 hours. Do not move the plate during this time and take measures to avoid evaporation (e.g. by wrapping the plate in aluminium foil).

## C Detection of spots

1. Remove the cells by emptying the plate and wash 5 times with PBS, 200  $\mu$ l/well.
2. Dilute the detection antibody (7-B6-1-biotin) to 1  $\mu$ g/ml in PBS containing 0.5% fetal calf serum (PBS-0.5% FCS). Add 100  $\mu$ l/well and incubate for 2 hours at room temperature.
3. Wash plate as above (step C1).
4. Dilute the Streptavidin-HRP (1:1000) in PBS-0.5% FCS and add 100  $\mu$ l/well. Incubate for 1 hour at room temperature.  
*Please note that sodium azide used in buffers will inhibit HRP activity.*
5. Wash plate as above (step C1).
6. Add 100  $\mu$ l/well of the ready-to-use TMB substrate solution and develop until distinct spots emerge.
7. Stop color development by washing extensively in deionized water. Remove the plate frame from the plastic tray and rinse the underside of the membrane.
8. Leave the plate to dry. Inspect and count spots in an ELISpot reader or in a dissection microscope.
9. Store plate in the dark at room temperature.

# Hints and Comments

These suggestions are based on the detection of antigen-specific immune responses using PBMC. If using clones, mixtures of separated cell fractions etc., other protocols may have to be considered.

## Plate washing

Washing of plates can be done using a multi-channel micropipette. In washing steps not requiring sterile conditions (C1-C5), a regular ELISA plate washer can also be used, provided that the washing head is adapted to the ELISpot plates.

## Cells

Both freshly prepared and cryopreserved cells may be used in the assay. However it is recommended that the latter are rested for at least one hour to allow removal of cell debris before addition to the plate. Triplicates or duplicates of 250,000 cells per well are often used to assess antigen-specific responses. For polyclonal activators, the cell number may have to be reduced to avoid confluent spot formation. Protocols with other incubation times have to be established by the user.

Anti-CD28 mAb provides a co-stimulatory signal to antigen-specific responses by binding to CD28 on T cells. Addition of an anti-CD28 mAb together with antigen (step B1) can be used to enhance antigen-specific responses. However, if the concentration of anti-CD28 mAb is too high, non-specific cytokine secretion may be elevated.

## Serum

The serum should be selected to support cell culture and give low background staining. We recommend the use of fetal calf serum. Alternatively serum-free medium evaluated for cell culture can be used. Human serum is not recommended as it may contain heterophilic antibodies or intrinsic analyte which may interfere with the assay.

## Assay controls

The number of cells responding to stimulation is often compared to the number of cells spontaneously producing the cytokine, which is determined by incubating the same number of cells in the absence of stimuli. It is recommended to include sample from a SARS-CoV-2 negative individual. A polyclonal activator, such as the included anti-CD3 mAb or phytohemagglutinin (1-10  $\mu\text{g/ml}$ ), is often used as a control for cell viability and functionality of the test system.

## Detection antibody

Diluted detection mAb can be filtered (0.2  $\mu\text{m}$ ) to reduce the risk of unspecific background.

## Buffers

PBS for washing and dilution should be filtered (0.2  $\mu\text{m}$ ) for optimal results. Avoid the inclusion of Tween or other detergents in the washing and incubation buffers.

## Substrate development

Development is made until distinct spots are visible in positive wells (usually 5-30 minutes). A general darkening of the membrane may occur during development but disappears after drying. Preferably

Developed and manufactured by MABTECH AB, Sweden, whose quality management system complies with the standards ISO 9001:2015 & ISO 13485:2016.
